Foreword

by

GOVERNOR DAN THORNTON

It is with genuine pleasure that I endorse this volume of Colorado Agricultural Statistics and recommend it for thoughtful consideration by all of our citizens, especially those working in and with the agricultural industry both inside and outside the state's borders. This bulletin portrays most effectively the significance of Colorado's greatest industry . . . agriculture. The facts herein contained are of obvious value to farmers and ranchers who are producers of our crops and livestock. They are of value also to processors of these commodities and those agencies which transport them to consumer markets. These data are also useful to the agencies of county and state government in the economic development of our natural resources. They serve as a guide to formulating useful agricultural legislation and development of wise agricultural policy by our farm organization and commodity group leaders.

The development of these statistics is particularly significant in that they are the product of cooperative effort between the Agricultural Department of the State of Colorado and the U. S. Department of Agriculture. These agencies are regularly surveying the agricultural industry in all its branches in order to measure adequately the significant changes which are taking place from season

to season and year to year. I most respectfully request those who produce our crops and livestock and those who process, store and transport them to cooperate with these service agencies through returning their questionnaires so that they may continue to compile a faithful record of this important and diversified industry.

Much of the county data contained in this bulletin results from the crop acreage census taken by county assessors and their deputies each year. I would like to take this opportunity to urge them to perform these duties faithfully and to recommend that producers place their crop acreages fully on record with these county officials. In so doing, they will serve the best interests of the agricultural industry and the state and national welfare.

In closing I would like again to recommend this bulletin for thoughtful consideration by consumers and all others who have a stake in Colorado's greatest industry.

A handwritten signature in dark ink, reading "Dan Thornton". The script is fluid and cursive, with the first letters of "Dan" and "Thornton" being capitalized and prominent.

DAN THORNTON,
Governor of Colorado.

WHY CROP AND LIVESTOCK REPORTS

- A man's judgment is no better than his facts and crop reports are the basic facts of Agriculture.
- They aid farmers in planning their production and marketing.
- They are essential in enacting wise legislation affecting Agriculture.
- They are the basis for analysis of agricultural and other business conditions.
- They enable railroads to make a better distribution of cars for moving farm products.
- They give producers the same foresight to future price trends that organized dealers possess.
- They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.
- They are indispensable in times of war because food is as essential as ammunition and weapons of war.
- They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.
- They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.
- They give information on surplus and deficit areas of production making possible a more economical distribution of products.
- They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.
- They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.
- They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.
- They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.
- They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.
- They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.

THE IMPORTANCE OF AGRICULTURE IN COLORADO AS A PRODUCER
OF NEW WEALTH AND AS A PRODUCER OF DOLLAR INCOME
IN RELATION TO "TOTAL INCOME PAYMENTS"

Agriculture is the principal industry in Colorado and the principal producer of new wealth. In recent years the annual income from sale of principal farm products both crop and livestock has exceeded one-half billion dollars annually. In 1950 this total was 506 million dollars and in 1951, 537 million dollars. These totals represent the original cash "take" of people in agricultural pursuits at the farm or ranch gate. They in no way take into account the fact that the processing of these raw materials provides at least one-third of the value added by manufacture in the state's industrial plants (milling, meat packing, sugar refining, etc.). In 1947 the value added by manufacture of all commodities in Colorado industrial plants amounted to 287 million dollars, according to the U. S. Department of Commerce report on Census of Manufacturers. (Cash receipts from sale of farm products totalled 502 million dollars in that year.) Neither does the cash receipts from sale of farm products figure include the important contribution these raw materials make to the traffic of the transportation industry, both rail and truck. Likewise this total does not measure the business created for the bag and package industry in the form of burlap and feed sacks, baskets, crates and minor containers for fruits, vegetables and other principal perishable commodities, nor does it include any measure of the impetus given to the overall economy—farm machinery and equipment, fuel, building, etc. These raw materials have an important way of pyramiding in their effect on the industry and commerce of the state.

In the early days Colorado was known largely as a mining state, and these new dollars as they came from the state's mines, primarily in the form of precious metals, added tremendous purchasing power and did much to build the state's early large buildings, resort hotels, and its railroads and mountain roads. This new wealth had tremendous effect in developing pioneer country because the purchasing power of these "mining" dollars was great. It is obvious, however, from the table below that mining, including coal and petroleum, now in no way compares with agriculture in importance as an income producer or a producer of raw materials for processing. The tourist business is important in that it brings to the state considerable quantities of new cash which would otherwise mostly remain outside the state's borders, but even this important industry is comparatively small when related to the importance of agriculture.

The table facing this page shows the total cash payments to individuals as determined by the Department of Commerce. In these totals are included the income from agriculture as shown under the heading, "Cash Receipts from Sale of Farm Products." Other items of income mentioned previously, such as payments to factory workers, workers for transportation agencies, are in no way credited to agriculture. The figures are, therefore, and for some other reasons, not strictly comparable, but they do serve to emphasize the importance of the agricultural industry.

¹ These data are taken from the August 1951 issue—Survey of Current Business published by the U. S. Dept. of Commerce, under the heading "Total Income Payments to Individuals." Included is a long list of agencies public and private which pay cash to individuals and investors. For complete detail see "Technical Notes" in August 1950 issue of Survey of Current Business.

² Compiled from Minerals Yearbook of the U. S. Bureau of Mines for the years concerned. Reported values were rounded to the nearest thousand dollars for ease of presentation and comparability with other income data.

³ In addition to minerals shown separately this total includes primarily molybdenum, vanadium, tungsten, natural gas together with sand and gravel and a number of other minerals of lesser importance. Individual data on some minerals are not separately available for security reasons.

COLORADO LAND AREA, OWNERSHIP AND OPERATION

The table below gives the principal types of ownership and supervision of Colorado lands. The subject of land ownership, especially as it relates to that owned or supervised by agencies of the Federal Government, has been one of increasing interest in recent years. Although the information given in the facing table is for the most part clear, some discussion and explanation seem necessary.

The area owned by the Federal Government and supervised by the various Federal agencies totals nearly 25 million acres or 37.4 percent of the 66½ million total acres of Colorado land area. Within this total the land under supervision of the Department of Agriculture comprises approximately 14¼ million acres. The Forest Service supervises about 13¾ million acres of the Department of Agriculture holdings and the Soil Conservation Service over ½ million acres. Forest Service lands have been under government supervision for many years but those under the jurisdiction of the Soil Conservation Service were acquired as a part of the land purchase program of the mid-1930's and are located mostly in Weld and Baca Counties.

The Department of the Interior supervises over 10 million acres of which nearly 8½ million acres are in the so-called public domain and are primarily grazing lands. Another principal supervising agency in the Department of the Interior is the Bureau of Indian Affairs with nearly ¾ million acres held as Indian reservations. The National Park Service holdings total a little over ½ million acres and consist primarily of Rocky Mountain National Park and Mesa Verde National Park. Smaller areas comprise the several national monuments. The Bureau of Reclamation supervises something less than ½ million acres principally in connection with the Colorado-Big Thompson water diversion and power development project.

It is noteworthy that the Departments of the Army, Navy and Air Force, together with the Atomic Energy Commission, hold nearly ½ million acres. These totals are given in detail below.

Land under supervision of the Colorado State Land Board exceeds 3 million acres or about 4.6 percent of the state's land area. These lands represent those reserved for school fund purposes.

The latest report of the U. S. Bureau of the Census reveals that nearly 38 million acres of land are classified as being in farms and ranches. This total comprises 57.1 percent of the state's land area. In appraising this total and this percentage, it should be borne in mind that much of the state-owned school land is also included in the area reported by the Census as being in farms and ranches. The amount of this duplication is not accurately known. For purposes of comparison, it is significant that the 1950 report of the Colorado Tax Commission shows 37½ million acres of agricultural land as being on the tax rolls. This total does not include mineral lands and other miscellaneous land not in farms and ranches, or the more than 3 million acres of school land since school lands are not taxed.

As presented in the preceding statement and in the tabular summary below, 37.4 percent of the Colorado land area is under the supervision of Federal Government agencies, 57.1 percent is in farms and ranches, 4.6 percent in school land and the remaining 0.9 is in other lands which would include the spread of cities, villages, etc. These percentages add to 100. The data have been presented in this manner for purposes of illustration, but because of the duplication between school lands and farm lands, the percentages are not exactly correct. This information on ownership and supervision of lands has been compiled from authentic sources in response to the many requests for this type of information.

FLOYD K. REED,
Agricultural Statistician

⁴Amount needed to account for area not included in the three categories above.

⁵Compiled from 1950 Annual Report of the Colorado Tax Commission.

REVIEW OF THE 1950 CROP SEASON

Total production of crops in 1950 was much below the unusually large volume produced in 1949 and well under the 10-year average. Production of feed grains at 24.1 million bushels against 47.0 million bushels in 1949 was the lowest in recent years and hay production at 1,977,000 tons was the smallest since 1940. Fruit crops yielded about half the 1949 volume.

Dry cold spring weather with late killing frosts in 1950 gave spring planted field crops a poor start and caused much freeze damage to fruit. Serious drought developed during the spring and early summer in southeastern Colorado, and it was also very dry in south central and western areas as the season progressed. Infestation of aphids was unusually severe in oats and barley fields in the northern part of the state and yields were lowered from early season indications. Some recovery of late maturing crops was possible during the fall months due to the long frost-free growing period in September and October but this was not sufficient to offset earlier handicaps.

Total acreage planted to principal crops estimated at 7,428,000 acres in 1950 was 6 percent below the 1949 total. Dry weather and damage from other causes resulted in rather heavy abandonment of non-irrigated crops with the result that total harvested acreage in 1950 at 5,843,000 acres was 17 percent less than that of 1949. However, higher prices in 1950 than in 1949 for a number of farm crops and livestock species offset to some extent the lower 1950 crop production in its effect on farm income.

General rains in late June and July relieved the drought situation in the southeastern part of the state, and July and August rains improved late row crops in the eastern part of the state over earlier prospects. Sorghums and broomcorn were planted unusually late and the summer moisture together with the long frost-free period in the fall made it possible to produce a better volume of these crops than seemed possible earlier.

The spread between the yields of irrigated crops and non-irrigated crops was unusually wide because reservoir water and pump irrigation held up well during the season. Irrigated potatoes and sugar beets yielded well on a reduced acreage. As a whole, hay crops did not do too well in 1950 because of the cold, dry spring. The first two cuttings of alfalfa were poor, but an unusually late fall growing season produced a good third cutting.

Potatoes—The acreage planted to potatoes in 1950 continued the downward trend which had been underway for a number of years and only 57,000 acres were planted. Although conditions were not entirely satisfactory throughout the growing season, a very favorable period of late fall weather resulted in unusually high acre yields in northern Colorado, and these same favorable late conditions augmented the yield elsewhere in the state. Hail loss in the San Luis Valley was unusual, but this served mostly to reduce yields rather than to cause complete abandonment of acreage. Production in 1950 totalled 18,200,000 bushels compared with 19,057,000 bushels in 1949 and was moderately above average. Prices per bushel were the lowest in several years, and the crop was inventoried at only \$18,928,000. The trend in Colorado potato yields has been sharply upward, and in spite of the adverse influences experienced, the yield at 325 bushels per acre was the highest ever obtained and quality was very good.

Dry Beans—The 1950 bean crop was estimated at 1,816,000—100 lb. bags. This crop was the smallest in four years and much under the large crop of 1949. The yield per acre averaged 760 pounds primarily because the yields of irrigated beans were exceptionally high at 1,520 pounds per acre. The yield of non-irrigated beans was low at 280 pounds. The acreage planted in 1950 at 261,000 acres was the smallest since the early 1920's. Abandonment was fairly large and only 239,000 acres were harvested compared with 295,000 acres harvested in 1949. The 1950 crop was valued at \$11,316,000, down over \$4 million from the value placed on the 1949 crop.

Sugar Beets—The year 1950 was another favorable one for sugar beets and production was above average at 2,183,000 tons. The crop averaged 15 tons from 146,000 acres harvested. Adequate irrigation water in the principal producing areas, together with a long frost-free growing period in the fall, was an important factor in attaining the high tonnage and good sugar content. The fall growing season was probably one of the most favorable ever experienced. Growers received an average of \$12 per ton, the highest ever paid and the crop was valued at \$26,196,000, the second highest total. The 1949 crop totalled 1,878,000 tons and the average yield at 16.1 tons was the highest ever obtained. Acreage harvested was 117,000 acres and acreage planted 126,000 acres.

Winter Wheat—Acreage restrictions were in effect under the Production & Marketing Administration control program in the fall of 1949 when plans were made for 1950 winter wheat production. As a result the acreage planted totalled only 3,085,000 acres, a decrease of 8 percent from the record-high plantings of 3,353,000 acres in the fall of 1948 for 1949 harvest. The winter of 1949-50 was quite dry and open and abandonment was large and only 2,199,000 acres were harvested. A large portion of this abandonment was in southeastern Colorado where the acreage harvested was very small and yield per acre low. For the state as a whole, the crop averaged 16.0 bushels the same as 1949 average, and production totalled 35,184,000 bushels. Even with the large acreage loss and the comparatively low yield for recent years, the 1950 crop was still the fifth largest ever harvested. Production totalled 42,384,000 bushels in 1949 and the record-high total was 56,038,000 bushels in 1947. The 1950 crop moved at comparatively high prices and was valued at a little over \$70 million, a reduction of only \$9 million from the 1949 crop value. In recent years winter wheat has been the principal cash crop income producer.

Spring Wheat—The acreage planted to spring wheat was reduced sharply from the high 1949 area. The season was generally unfavorable in eastern non-irrigated areas, and abandonment was high and yields low. Production totalled only 1,725,000 bushels, the smallest crop in this century. Experience with this crop in eastern non-irrigated sections has not been satisfactory, and such acreage has declined sharply in the last ten years with the exception of the large plantings in 1949. Irrigated acreage has declined also but has been fairly well maintained in the San Luis Valley and in western areas. Production in 1949 was 3,780,000 bushels, but spring wheat crops of other recent years have been near the 2 million bushel level. The 1950 spring wheat crop was valued at \$3,364,000 and less than half the value of the 1949 crop.

Corn—The 1950 corn crop of 13,368,000 bushels was considerably smaller than that of 1949 which totalled 16,401,000 bushels and was about average. Smaller planted acreage in 1950 with larger percentage abandonment than had been experienced in recent years resulted in a sharp reduction in harvested acreage compared with 1949. Good yields obtained on the small acreage held the total production up. With a comparatively high price per bushel for the crop, the total value exceeded all other years of record except 1947. Significant too was the small percent of the total acreage harvested that was harvested for grain and the large percentage harvested for silage. The large silage acreage was due in some respects to the lateness of some corn acreage, the shortage of hay, and the large number of cattle in feed lots, especially in northern Colorado where a goodly percentage of the state's silage is normally cut. It is of interest to note that considerable corn for silage was contracted in the fields by commercial cattle feeders.

Oats—The smallest production of oats since 1940 resulted from the lowest yield per acre in recent years and the highest abandonment of planted acreage since that date. A crop of only 4,940,000 bushels was produced from 190,000 acres of oats cut for grain in 1950. The crop was valued at \$4,495,000. The 1949 crop was 7,684,000 bushels and the 10-year average 5,675,000 bushels.

Barley—Winter barley plantings were large in the fall of 1949 due to the curtailment of winter wheat acreage. The winter was dry and open and most of this acreage winter killed. Total plantings of barley (both winter and spring) for 1950 harvest were estimated at 822,000 acres. However, the largest abandonment since 1934 reduced the harvested acreage to 489,000 acres, the smallest in 10 years, and 38 percent less than the 788,000 acres harvested in 1949. Production in 1950 was only 9,536,000 bushels worth \$10,871,000. This compared with 22,143,000 bushels harvested in 1949 worth \$19,929,000.

Sorghums—In sharp contrast with the record production of grain in 1949 at 5,298,000 bushels, the 1950 crop amounted to only 1,236,000 bushels and was the smallest crop since 1939. The acreage harvested for grain was unusually small at 103,000 acres and the yield per acre was low. It is noteworthy that this crop was of particular value in Baca and other southeastern counties where sorghums were planted as a catch crop on abandoned winter wheat ground. The very late fall enabled these plantings to produce a large quantity of forage and even considerable grain with the result that many cattle were wintered in that area at good returns. Because such a large acreage of sorghum failed to produce a satisfactory grain yield, the area cut for forage was comparatively large at 350,000 acres. The yield of forage, although below average, was fairly satisfactory and a total of 350,000 tons were harvested. This exceeded the 322,000 tons harvested in 1949. The price received for this roughage averaged \$15 and the crop was inventoried in excess of \$5 million.

Hay Crops—Cold, dry weather during the early spring months of 1950 gave hay crops a poor start and held yields generally below those of recent years. The acreage cut was the lowest in many years and production the smallest in 10 years. Production was particularly small in relation to the number of hay-consuming animal units. It is noteworthy that, when hay crops start off poorly in the spring, rarely is this shortage overcome by favorable weather later in the season. The exceptionally late frost date and favorable growing temperatures which continued late into the fall of 1950 offset a portion of the adverse spring influences, but even these favorable conditions did not overcome the early handicap. These basic facts are significant in appraising hay crop prospects in future years.

Alfalfa benefitted most from the favorable fall conditions, but even so the crop of 1,268,000 tons was a small one in comparison with those harvested in recent preceding years. The pinch of this drop in production from 1,425,000 tons in 1949 was particularly severe because much of the crop moved into dehydration and other commercial processing channels, and the number of cattle in winter feed lots was large. This combination of circumstances resulted in record-high hay prices.

The wild hay crop at 384,000 tons was about 100,000 tons under the 1949 total and one of the small crops of recent years. This short wild hay supply was particularly felt in the mountain meadow areas and in the San Luis Valley where it was necessary to move a considerable number of stock cattle to other feed during the winter months. The area cut in 1950 totalled only 427,000 acres compared with 474,000 acres in 1949. Clover and timothy production was also at a level considerably lower than the preceding year at 195,000 tons and the lowest since 1937. The crop of other tame hay especially in eastern Colorado was also short. Some of the adverse influences which affected small grains resulted in about the usual acreage of such crops being cut for hay and the quantity of this hay harvested in 1950 exceeded that of the previous year.

Broomcorn—Broomcorn was planted unusually late in 1950 because of excessive spring moisture, and the crop was the smallest in 11 years. Many fields of broomcorn were planted as late as mid-July and the outcome was doubtful. However, many of these fields yielded considerable usable brush as a result of the record late frost date which occurred after November 1. Although this brush was usable, much of it was short and lacked the usual weight and substance. Production finally totalled 7,200 tons although early it looked as though the crop might not make over two-thirds that much. The short crop of 1950 was particularly significant in that it followed the fairly large crop of 11,700 tons harvested in 1949. The crop was quite short in other parts

of the broomcorn producing southwestern area in 1950 and Colorado's position as a broomcorn producer was quite well maintained with 25 percent of the nation's total. Prices paid for the 1950 crop averaged \$371 per ton, a record-high average. Much of the better quality brush sold in excess of \$500 per ton. Total value of the short crop was \$2,671,000 and compared favorably with the value of the crops of several preceding years.

Alfalfa Seed—Production totalled only 47,000 bushels of thresher-run seed compared with 70,000 bushels, the large crop of 1949. The 1949 production, however, was above average. Most of this seed was produced in the Arkansas Valley where dry weather favored seed production. The clean-out was fairly heavy. Prices were unusually high and the 1950 crop was valued at \$1,307,000.

Sweetclover Seed—The season was quite favorable for sweetclover seed and 14,000 acres were harvested for a production of 61,000 bushels thresher-run. Production in 1949 was 52,000 bushels. Although the acreage cut was much larger, yield was much lower than the 5.17 bushels obtained in 1949. The 1950 crop was valued at \$476,000.

FRUIT CROPS

Apples—The 1950 apple crop was very short due to winter freeze damage. A commercial crop of only 882,000 bushels, the smallest in many years, was harvested. This short crop was in sharp contrast to the large crop of 1,570,000 bushels produced in 1949, much of which went unharvested. A large percentage of Colorado's commercial apple crop is produced in Delta County in western Colorado. In normal years the crop in Fremont County is fairly large and commercial apples are also produced in Montezuma, Montrose, Larimer, Garfield and La Plata Counties. Jonathan and Delicious are important commercial varieties.

Peaches—The 1950 peach crop was the shortest in many years at 1,219,000 bushels. The shortage resulted primarily from the almost total failure in Delta County. The crop in Mesa County was fair to good, and the crop moved at fairly remunerative prices after two unprofitable years. Mesa County is the principal producer and a large percentage of the crop is of the Alberta variety. Some peaches are also produced in Montrose, Montezuma and Garfield Counties. Growers averaged \$2.70 per bushel, and although the crop was on the whole remunerative, harvesting, transportation, packaging and container expenses were high and profit margins were narrow. The crop was inventoried at \$3,291,000, a little more than the previous year's large crop.

Cherries—The sour cherry crop in northern Colorado has been on the wane in recent years, and the crop in 1950 was exceptionally small due to unfavorable weather, being only 1,600 tons. This compared with 2,800 tons harvested in 1949 and the large crop of 4,300 tons in 1948. Few sweet cherries are produced in northern Colorado although the Ostheim variety is sometimes classified as sweet. Sweet cherry production is on the increase in western Colorado where Delta County is the principal producer followed by Garfield, Montrose and Mesa Counties. The 1950 crop was very short due to late freeze damage and totalled only 230 tons compared with 640 tons in 1949 and 820 tons in 1948. Many young orchards are approaching bearing age and the potential production of this good fruit is increasing quite rapidly.

TRUCK CROPS

(Commercial Vegetables)

Colorado vegetables are grown under widely diversified conditions at altitudes ranging from 3,500 feet to more than 8,000 feet above sea level. They are known throughout the country for their fine quality and flavor which can be obtained only in high altitudes where days are warm and nights are cool. Despite the comparatively short growing season, Colorado ranked sixth among the states of the Nation in total tonnage of vegetables produced for fresh market in 1949 and eighth in 1950. In certain seasons of the year Colorado furnishes most of the Nation's total commercial supplies of some vegetables. Colorado not only ranks high in the national production of truck crops for fresh market but considerable tonnage is also grown for processing in the State's canneries. The industry is an important one as related to the amount of labor employed, the gross value of the crops produced and the high returns per acre.

The truck crop areas comprise four principal sections in widely separated districts of the State. These might be described as being the Denver and Northern Colorado section, the Arkansas Valley section extending from Fremont County eastward to Prowers County, the San Luis Valley, and the lower western valleys located primarily in Montrose, Delta and Mesa Counties.

During recent years, the acreage planted to some crops grown for fresh market has declined significantly, reflecting the scarcity of labor, high cost of production and marketing, and unstable market conditions. The acreage grown for processing, however, has remained fairly constant. The rank of vegetables grown in Colorado in relation to the acreage devoted to each of them is as follows: onions, green peas, lettuce, cabbage, tomatoes, cauliflower, cucumbers, cantaloups, snap beans, carrots, spinach and celery. The principal crops in the above group which are utilized for processing are, green peas, tomatoes, cucumbers for pickles and snap beans. Other vegetables such as asparagus, lima beans, table beets, broccoli, sweet corn, green onions, peppers, radishes and turnips are also grown but the quantity is comparatively small. Colorado leads in the production of cantaloup and cucumber seed and production of dry onion seed has attained considerable volume in recent years.

A total of about 52,000 acres of commercial vegetables were grown for harvest in 1950 which yielded an aggregate production of 328,000 tons valued at \$8,721,000. In 1949, about 56,000 acres produced 378,000 tons of vegetables worth \$17,705,000. The 1950 season was characterized by over supplied national markets and disastrously low prices which made it a most unprofitable year for truck crop growers in this age of high costs of producing, processing and marketing of perishable farm products. It is estimated that a total of 87,000 tons of good quality vegetables were left unharvested that year because supplies exceeded demand.

Onions—Although production of dry onions has declined sharply since the record high output of 7,290,000 50-pound sacks in 1946, Colorado still ranks near the top among the states in the late storage onion group. In 1949, Colorado ranked second with a production of 5,650,000 sacks which amounted to 19 percent of the Nation's total fall and winter onion supplies. The State held third place in 1950 with a production of 4,510,000 sacks or 13 percent of the national crop. The 1950 season was extremely unprofitable for onion growers and more than 900,000 sacks were not harvested because of glutted national markets and low prices. This deal was particularly disastrous for Arkansas Valley growers where small sizes and poor quality onions on a large acreage pulled the State's average yield per acre down to the lowest in 14 years. The 1950 crop was worth only \$2,520,000 compared with the \$7,628,000 valuation of the 1949 crop. This poor remunerative return to growers in 1950 was doubly costly in light of the high cost of production and marketing. The acreage brought to maturity in 1950 is placed at 11,000 acres, of which a considerable portion was not harvested for reasons given above. In 1949, 11,300 acres were harvested.

Green Peas—For more than two decades the larger portion of the acreage devoted to this crop was grown for fresh market consumption but in 1950 canning peas took the lead. The acreage grown for fresh market has declined significantly each year since the peak of 14,500 acres were harvested in 1943, while the acreage utilized for processing has shown only a moderate decline. Only 3,700 acres were harvested for market in 1950, the smallest since 1926. In 1949, the harvested area amounted to 5,500 acres. Pea growers have been beset with the difficult problems of labor shortages, high cost of production and adverse weather losses, but the factor mostly responsible for the consistent decline in acreage has been the rapid expansion of the quick-freeze industry in other parts of the country in recent years which has made sharper inroads into the fresh pea market than that of any other vegetable grown in Colorado. Production of fresh peas in 1950 totalled 296,000 bushels, valued at \$533,000, which amounted to well over half of the Nation's summer green pea supplies despite the sharp drop in volume. The 1949 crop of 578,000 bushels was worth \$780,000. These current production figures amount to only a small fraction of the record high output of 1,755,000 bushels harvested in 1941. Production of green peas utilized for processing has shown less change through the years. The 1950 crop of 3,700 tons (shelled) was worth \$257,000 to growers while in 1949 a total of 4,040 tons were produced with a cash value of \$298,000.

Lettuce—The acreage devoted to lettuce was expanded by more than 50 percent in 1948 and totalled 7,000 acres. This was the largest area in 16 years, and the acreage has remained at a high level since that date. However, as a result of a national over-supply, growers have been unable to dispose of these large crops and each year huge quantities of good quality lettuce have been left in the fields. In 1950, production on 7,400 acres amounted to 888,000 crates but more than half of this lettuce was not harvested and the crop carried a cash value of only \$455,000 on the portion marketed. The average seasonal price to growers was \$1.30 per crate, the lowest received since 1941, despite a sharp increase in the cost of production. In 1949, a total of 6,500 acres produced 780,000 crates worth \$1,530,000. About one-fourth of this crop was left unharvested because of unfavorable marketing conditions.

Cabbage—Domestic type cabbage supplies the summer market and a small amount utilized for the manufacture of kraut, while fall and early winter markets are supplied with the Danish type together with some late domestic cabbage. The over-all acreage does not change greatly from year to year. In 1950, a total crop of 74,400 tons of cabbage were brought to maturity but only 36,600 tons were harvested bearing a cash value of \$416,000. Prices obtainable by growers were the lowest of any year since 1940 and during much of the season failed to justify the high cost of harvesting and marketing. At the usual peak marketing periods, there was not sufficient demand for the cabbage available at any price. The 1949 aggregate production of 80,700 tons was worth \$1,668,000.

Tomatoes—About two-thirds of the acreage is grown for processing, either as juice or fruit. The acreage devoted to fresh market consumption has declined considerably in recent years. Production of tomatoes for canning in 1950 totalled 20,100 tons against 19,700 tons in 1949, while production for fresh market in 1950 amounted to 405,000 bushels compared with 408,000 bushels in 1949.

Cauliflower—Colorado produces about one-third of the Nation's summer cauliflower, and for a period between New York's summer and early fall Long Island deals, Colorado is the principal source of supplies. About 70 percent of the State's crop is grown in the San Luis Valley. Production in 1950 is estimated at 742,000 crates of which only 642,000 crates were harvested, with a cash value of \$482,000. This "economic" abandonment was caused by an over-supplied market and the lowest prices received by growers in six years. The 1949 crop totalled 840,000 crates worth \$798,000. The area brought to maturity in 1950 is placed at 2,700 acres compared with 2,800 acres harvested in 1949.

Cantaloups—The cantaloup industry has fallen a long way from the prominent position it once held in Colorado agriculture. The largest production of record was in 1929 when 9,460 acres yielded a crop valued at more than one million dollars. Inadequate demand and low prices together with repeated severe hail and disease losses, particularly in the once-important Arkansas Valley, have discouraged cantaloup production. The decline has continued in recent years and in 1950 only 2,400 acres were harvested and production dropped to 240,000 crates valued at \$261,000. In 1949, a total of 3,500 acres produced 332,000 crates worth \$378,000 to growers. Approximately 25 percent of the 1950 crop and 19 percent of the 1949 crop were not harvested because of unfavorable markets and the failure of prices received to keep pace with rising operating costs.

Snap Beans—This crop is grown for both fresh market and for processing. The acreage devoted to fresh markets has declined so consistently through the last decade that about two-thirds of the crop is not utilized for canning—just the reverse to the breakdown in the 1930's. Production for canning in 1950 amounted to 5,100 tons compared with 6,000 tons in 1949, while the crop produced for fresh market totalled 120,000 bushels in 1950 against 90,000 bushels in 1949. Approximately 20 percent of the 1950 fresh market crop was not harvested because of slow demand and low prices.

¹In certain years, production includes some quantities not harvested because of economic conditions and, excluded in computing value.²Estimates of commercial apples relate to production in 7 commercial counties (Larimer, Delta, Garfield, Mesa, Montezuma, Montrose and Fremont), which produce about 95 percent of the total apples produced in the state.

¹ Stocks as a percentage of crop produced in current year (year of harvest).

² Stocks as a percentage of crop produced in first preceding year (year of harvest).

³ Percentages given are stocks as a percentage of the amount of corn harvested "for grain."

LIVESTOCK INVENTORY AND VALUE—JANUARY 1, 1952 and 1951

The total value of all livestock and poultry continued the increase during 1950 and 1951 which had been underway for a number of years. By January 1951 this aggregate value had increased to \$387,723,000 and by January 1952 to \$453,886,000. Both these figures were new record highs. The increases resulted from larger numbers as well as from larger per unit valuations for all species except hogs for which both number and value were lower on January 1, 1952, than a year earlier. The table above summarizes these data completely.

Cattle and Calves—The number of all cattle and calves on January 1, 1952, was at a record-high level. This increase resulted both from a record number of cattle and calves being placed in feed lots and from further increase in the number of stock cattle. The increase during 1951 was particularly significant because it occurred even though feed was scarce in some parts of the state and high priced throughout the territory. It was also significant because it followed a rather substantial increase in numbers during 1950. The record inventory as of January 1, 1952, is also significant in that it contained a record-high number of cows two years old and over being kept primarily for milking and breeding purposes and also contained a record number of one to two year old heifers being held for replacement. Both these figures indicate high potential calf crops during 1952 and subsequent years if this inventory is maintained. The cattle inventory alone was valued at \$374,709,000 on January 1, 1952 and \$317,520,000 on January 1, 1951. Milk cow numbers and values are included in the above values and references. The number of milking animals has been on the decline since 1934 and on January 1, 1952, totalled only 186,000 head. Even with this sharp decline in numbers, however, milk production has held up quite well due to a general uptrend in average production per cow and specialization in the dairy industry. Value per head of milk cows on January 1, 1952, was \$264, a new record high and an increase from \$240 on January 1, 1951. The data on age and sex classification of cattle, together with numbers for earlier years, is given elsewhere in this bulletin. A complete historical record of numbers of cattle together with other species is shown in the Colorado Agricultural Statistics 1948 and 1949, issued in January 1951.

Sheep and Lambs—Stock sheep numbers increased during 1951 for the first time since the decline in numbers began in 1942, and on January 1, 1952, the total was 1,299,000 head. A year earlier 1,237,000 stock sheep and lambs were on Colorado ranches and farms. The record-high inventory of stock sheep was attained on January 1, 1942 with 1,889,000 head. The number at the beginning of 1952 was still 31 percent below this record number. There is little indication that sheep numbers will again attain this high level because of restricted use of the forest and other public lands as well as the fact that cattle have proven a more profitable ranch enterprise. Farm flock numbers are increasing moderately, and it is evident that range sheepmen are endeavoring to place their flocks in better condition as revealed by holding of 220,000 ewe lambs for breeding purposes at the beginning of 1952. This was the largest number of ewe lambs held since 1942. The stock sheep inventory of January 1952 was valued at \$44,296,000, an increase of over \$4 million during 1951 and an increase of about \$18 million from two years preceding. This value was the highest of record, but there has been substantial decline since that date.

Hogs and Pigs—Hog numbers have shown only moderate variation during recent years, but production declined moderately during 1950 and 1951. On January 1, 1952 numbers totalled only 312,000 head against 338,000 head two years earlier. Pig crops of 1950 and 1951 were both lower than in 1949 at 438,000 and 448,000 head respectively. In comparison with the value of cattle and sheep, hog values do not bulk large. The January 1952 inventory was valued at about \$8 million, down about \$1 million from the preceding January. Most Colorado hogs are produced in eastern Colorado but numbers are fairly large in parts of the San Luis Valley and the lower western valleys.

Horses and Mules—The draft horse is rapidly becoming the new "vanishing American." On January 1, 1952, only 102,000 total horses and colts were on farms and ranches, and approximately half these animals were saddle horses and cow ponies. The number declined 19,000 head or 16 percent during the two years 1950 and 1951, and the 1952 number was less than half that of only 10 years ago. The value of remaining horses continues at a low level, and the average for all horses and colts on January 1, 1952, was only \$31 per head and the total inventory was valued at little over \$3 million. Mule numbers total only 4,000 head and are of little present consequence in farm and ranch operations. Present numbers are only about 10 percent as large as a quarter of a century earlier.

Calf Crop—Calves born annually in Colorado beef and dairy herds have ranged between 600,000 and 700,000 head since 1941, but in several years the number has exceeded 700,000 head. One of these years was 1951 when births totalled 758,000 head and a record high number. This resulted from a large percentage of calves born in relation to the number of cows and heifers two years old and over on hand at the beginning of the year as well as the large number of such breeding animals. Considering the record inventory of cows of breeding age as of January 1952, indications are that the calf crop of this year will exceed any previous one.

Lamb Crop—The number of lambs saved in 1950 totalled 944,000 head. This total was only slightly larger than the 1949 crop, but marked the arrest of a downtrend in farm flock and range lamb production which started in 1943. An estimated 93 lambs per 100 ewes one year old or over was recorded for 1950. Although a smaller number of breeding ewes was estimated for 1951, a record high percentage of 97 lambs saved per 100 ewes resulted in an increase in the lamb crop over 1950 by more than 3 percent. The 1951 lamb crop totalled 975,000 head.

Lamb Feeding—During the late 1920's and early 1930's Colorado fed approximately 25 percent of the nation's drylot grain-finished lambs. Most of these animals were finished in the northern Colorado feeding area. This number declined rather rapidly until the early 1940's when the number became fairly stable at around the half million mark. On January 1, 1951, the number was the lowest in many years at 435,000 head, but on January 1, 1952 this number totalled 625,000 animals. The 1951 number turned a very good profit to feeders, but the 1952 numbers were placed in feed lots at high prices and marketed on a declining price level. Of the January 1, 1952 numbers 445,000 were in the northern Colorado area which covers the Fort Collins-Greeley section and the area extending northeast comprising the South Platte River Valley.

Cattle Feeding—In sharp contrast with the decline in numbers of lambs being fed, the number of cattle grain-finished in drylots for market has increased sharply in recent years and on January 1, 1951, 229,000 head of cattle and calves were being fattened. On January 1, 1952, this number set a new high record and totalled 300,000 head of which 260,000 head were in the northern Colorado area. The 1950-51 deal was a very profitable one, but the 1951-52 deal was less profitable and some feeders experienced significant losses. Many of these animals were placed in the feed lots at peak 1951 fall prices and were sold on a declining market. Difficulties were minimized in both seasons by the very favorable fall and winter weather. The northern Colorado area is particularly favored as a feeding section and further growth of this industry is indicated. Many new facilities have been built, some the best in the country. The area is advantageously located to the Denver, West Coast and Eastern fat cattle markets.

Wool—An average weight per fleece of 9.1 pounds in 1950 produced a total wool clip of 11,098,000 pounds. This was an increase of 10% over the small 1949 clip when an average fleece of 8.5 pounds yielded an aggregate production of 10,900,000 pounds. The 1950 crop grossed \$6,215,000 to producers which compared with the \$4,742,000 valuation for the 1949 clip. Although the number of sheep shorn declined from 1,215,000 head in 1950 to 1,200,000 head in 1951, a record high weight per fleece of 9.6 pounds produced a wool clip of 11,580,000 pounds in 1951, 4% above the 1950 clip and the largest crop produced since 1946. Producers received an average price of \$1.02 for their 1951 wool and the total value of the crop was estimated at \$11,812,000, 90% greater than the value of the 1950 crop.

Chickens and Eggs—The number of chickens (excluding broilers) produced on farms in Colorado dropped to 4,531,000 birds in 1950, 12 percent below the 1949 production of 5,144,000 birds. This represents the smallest production since 1935 and reflects the effect of higher cost of production without a corresponding increase in the value of the finished product. Of the chickens produced on farms in 1950, 3,399,000 were sold from the farm and 1,443,000 were eaten on the farms where produced. Eggs produced during 1950 totalled 425,000,000 compared with 400,000,000 in 1949. Chickens and eggs in 1950 provided a gross farm income of \$15,692,000 compared with \$19,609,000 in 1949. In 1951, Colorado farms produced 5,347,000 chickens, an increase of 18 percent over the low 1950 production and also exceeding all other years since 1947. 387,000,000 eggs were produced in 1951, and the gross farm income from chickens and eggs totalled \$19,375,000.

The commercial broiler industry has expanded significantly in Colorado in recent years. Despite the somewhat less favorable chicken-feed ratio, 1,638,000 broilers worth \$1,472,000 to producers were raised in 1950 as compared with 1,310,000 birds valued at \$1,238,000 in 1949. Continued expansion of the broiler industry brought production in 1951 to 2,129,000 birds, 30 percent greater than the 1950 output. Gross valuation in 1951, including consumption in households of producers was \$1,980,000.

Turkeys—Turkeys raised in Colorado during 1950 numbered 720,000 birds, 5 percent under 1949. Value of production was estimated at \$4,562,000. No significant change in numbers of turkeys raised took place in 1951 when a total of 721,000 birds were produced. Value of production, however, increased by 10 percent to \$5,452,000 due to a considerably higher value per bird.

¹ Computed from the value of milk, cream, and farm butter sold, divided by the quantity of milk or butterfat used in the preparation of these products for market.

² Milk and milk equivalent of cream and farm butter consumed, valued at the average returns for milk utilized in dairy products sold.

³ Value of combined sales plus value of products consumed in the farm household.
